Deep Generative Models: Discrete Latent Variables

Philip Schulz and Wilker Aziz

https:
//github.com/philschulz/VITutorial

 Deep Generative Models are probabilistic models where the parameters of the conditional distributions are computed by neural networks

- Deep Generative Models are probabilistic models where the parameters of the conditional distributions are computed by neural networks
- Because the ELBO cannot be computed exactly, we need to sample latent values

- Deep Generative Models are probabilistic models where the parameters of the conditional distributions are computed by neural networks
- Because the ELBO cannot be computed exactly, we need to sample latent values
- Main problem: the MC estimator is not differentiable

- Deep Generative Models are probabilistic models where the parameters of the conditional distributions are computed by neural networks
- Because the ELBO cannot be computed exactly, we need to sample latent values
- Main problem: the MC estimator is not differentiable
- Solution: reparametrisation gradient

Model Gradient

$$\frac{\partial}{\partial \theta} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z,\theta) \right] - \frac{\partial}{\partial \theta} \mathsf{KL} \left(q(z|\lambda) \mid\mid p(z|\theta) \right)$$

Model Gradient

$$\frac{\partial}{\partial \theta} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z,\theta) \right] - \frac{\partial}{\partial \theta} \operatorname{\mathsf{KL}} \left(q(z|\lambda) \mid\mid p(z|\theta) \right)$$

Inference Network Gradient

$$rac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z, \theta)
ight] - rac{\partial}{\partial \lambda} \, \mathsf{KL} \left(q(z|\lambda) \mid\mid p(z|\theta)
ight)$$

$$\frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z,\theta) \right]$$

$$\frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z,\theta) \right] = \frac{\partial}{\partial \lambda} \mathbb{E}_{\phi(\epsilon)} \left[\log p(x|\widehat{h^{-1}(\epsilon,\lambda)},\theta) \right] = 0$$

$$\frac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} [\log p(x|z,\theta)] = \frac{\partial}{\partial \lambda} \mathbb{E}_{\phi(\epsilon)} \left[\log p(x|\widehat{h^{-1}(\epsilon,\lambda)},\theta) \right] = \mathbb{E}_{\phi(\epsilon)} \left[\frac{\partial}{\partial z} \log p(x|\widehat{h^{-1}(\epsilon,\lambda)},\theta) \times \frac{\partial}{\partial \lambda} \widehat{h^{-1}(\epsilon,\lambda)} \right]$$

Reparametrisation for Discrete Variables?

Revisiting the Inference Gradient

Control Variates and Baselines

Semisupervised Learning

Reparametrisation

In order to tranform variables, we need to compute the Jacobian (matrix of derivatives).

$$p(z) = \phi(h(z)) \left| \frac{d}{dz} h(z) \right|$$

The Jacobian is generally not available for discrete variables.

Continuity

The outcome space of discrete variables is non-continuous. Thus, we cannot take derivatives with respect to real variables.

Reparametrisation for Discrete Variables?

Revisiting the Inference Gradient

Control Variates and Baselines

Semisupervised Learning

$$rac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z, heta)
ight] =$$

$$rac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z,\theta) \right] = \ rac{\partial}{\partial \lambda} \sum_{z} q(z|\lambda) \log p(x|z,\theta) = \$$

$$rac{\partial}{\partial \lambda} \mathbb{E}_{q(z|\lambda)} \left[\log p(x|z, \theta) \right] = \ rac{\partial}{\partial \lambda} \sum_{z} q(z|\lambda) \log p(x|z, \theta) = \ \sum_{z} rac{\partial}{\partial \lambda} q(z|\lambda) \log p(x|z, \theta)$$

Back to Basic Calculus

$$\frac{d}{d\lambda}\log f(\lambda)$$

Back to Basic Calculus

$$\frac{d}{d\lambda}\log f(\lambda) = \frac{\frac{d}{d\lambda}f(\lambda)}{f(\lambda)}$$

Back to Basic Calculus

$$\frac{d}{d\lambda}\log f(\lambda) = \frac{\frac{d}{d\lambda}f(\lambda)}{f(\lambda)}$$

Consequence

$$\frac{d}{d\lambda}f(\lambda) = \frac{d}{d\lambda}\log f(\lambda) \times f(\lambda)$$

$$\frac{d}{d\lambda}f(\lambda) = \frac{d}{d\lambda}\log f(\lambda) \times f(\lambda)$$

$$\frac{d}{d\lambda}f(\lambda) = \frac{d}{d\lambda}\log f(\lambda) \times f(\lambda)$$

Apply this to the ELBO derivative.

$$\sum_{z} \frac{\partial}{\partial \lambda} q(z|\lambda) \times \log p(x|z,\theta) =$$

$$\frac{d}{d\lambda}f(\lambda) = \frac{d}{d\lambda}\log f(\lambda) \times f(\lambda)$$

Apply this to the ELBO derivative.

$$\sum_{z} \frac{\partial}{\partial \lambda} q(z|\lambda) \times \log p(x|z,\theta) =$$

$$\sum_{z} q(z|\lambda) \frac{\partial}{\partial \lambda} \log q(z|\lambda) \times \log p(x|z,\theta) =$$

$$\frac{d}{d\lambda}f(\lambda) = \frac{d}{d\lambda}\log f(\lambda) \times f(\lambda)$$

Apply this to the ELBO derivative.

$$\sum_{z} \frac{\partial}{\partial \lambda} q(z|\lambda) \times \log p(x|z,\theta) =$$

$$\sum_{z} q(z|\lambda) \frac{\partial}{\partial \lambda} \log q(z|\lambda) \times \log p(x|z,\theta) =$$

$$\mathbb{E}_{q(z|\lambda)} \left[\frac{\partial}{\partial \lambda} \log q(z|\lambda) \times \log p(x|z,\theta) \right]$$

Comparison Between Estimators

Score function gradient

$$\mathbb{E}_{q(z|\lambda)}\left[rac{\partial}{\partial \lambda}\log q(z|\lambda) imes \log p(x|z, heta)
ight]$$

Reparametrisation gradient

$$\mathbb{E}_{\phi(\epsilon)} \left[\frac{\partial}{\partial \lambda} \log p(x|h^{-1}(\epsilon,\lambda),\theta) \right]$$

Example Model

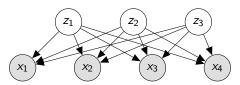

Let us consider a latent factor model for topic modelling. Each document x consists of n i.i.d. categorical draws from that model. The categorical distribution in turn depends on the binary latent factors $z = (z_1, \ldots, z_k)$ which are also i.i.d.

$$Z_j \sim \mathsf{Bernoulli}\left(\phi\right) \qquad (1 \leq j \leq k)$$

 $X_i | z \sim \mathsf{Categorical}\left(g(z)\right) \quad (1 \leq i \leq n)$

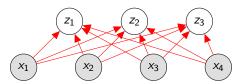

Here $g(\cdot)$ is a function computed by neural network with softmax output.

Example Model

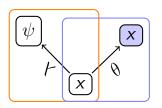

At inference time the latent variables are marginally dependent. For our variational distribution we are going to assume that they are not (recall: mean field assumption).

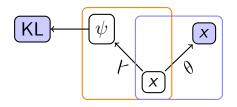

Inference Network

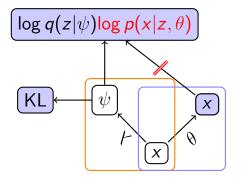

The inference network needs to predict k Bernoulli parameters ψ . Any neural network with sigmoid output will do that job.

Pros and Cons

- Pros
 - Applicable to all distributions
 - Many libraries come with samplers for common distributions

Pros and Cons

- Pros
 - Applicable to all distributions
 - Many libraries come with samplers for common distributions
- Cons
 - ▶ High Variance!

Reparametrisation for Discrete Variables?

Revisiting the Inference Gradient

Control Variates and Baselines

Semisupervised Learning

Baselines

We attempt to centre the gradient estimate. To do this we learn a quantity \mathcal{C} that we subtract from the reconstruction loss.

$$\log q(z|\lambda) (\log p(x|z,\theta) - C)$$

We call C a baseline. It does not change the expected gradient (Williams, 1992).

Baselines

We can make baselines input-dependent to make them more flexible.

$$\log q(z|\lambda) \left(\log p(x|z,\theta) - C(x;\omega)\right)$$

However, baselines may not depend on the random value z! Quantities that may depend on the random value (C(z)) are called **control variates**. See Blei et al. (2012); Ranganath et al. (2014); Gregor et al. (2014).

Baselines

Baselines are predicted by a regression model (e.g. a neural net). The model is trained using an L_2 -loss.

$$\min_{\omega} \left(C(x; \omega) - \log p(x|z, \theta) \right)^2$$

 Reparametrisation not available for discrete variables.

- Reparametrisation not available for discrete variables.
- Use score function estimator.

- Reparametrisation not available for discrete variables.
- Use score function estimator.
- ▶ High variance.

- Reparametrisation not available for discrete variables.
- Use score function estimator.
- ► High variance.
- Always use baselines for variance reduction!

We now know how to handle continuous and discrete latent variables. Let us combine these two treat partially observed data.
